

For you to try today!

Next Generation Human Computer Interaction

Now it's possible to control a computer using nothing but your eyes.
Just look at the screen and things start to happen!

During the spring of 2008 a new form of human computer interface has been developed. Using eye trackers to record the direction of eye gaze we have created a prototype for new way of interacting with computers.

To evaluate the functionality of this prototype we need your help. The test will require about 30 minutes of your time. The test aims at gathering data on peoples experience of using the interface.

Your participation is anonymous, no information can later on be traced back to you. The combined results of the study will be presented in a masters thesis published by the end of May.

We seek

- 20-30 Participants
- Male or Female
- Any age
- Any background

Why participate

- It's fresh, it's fun and you were among the first in the world to try it.

Please notice

- You are free to dismiss the experiment at any time - without any reason what so ever.
- Please do not wear any mascara as it might interfere with the eye tracker.

What: Gaze Interaction Evaluation

When: 21 April - 27 April 2008

Where: Humanistlaboratoriet in the basement of the SOL library.

Time: 12.00 - 19.00

If you wish to participate send an email with your **name** and the **day & time** that will be the best choice for you to the address below.
